The main idea

What if we committed **every** time the tests passed?

Then we should revert **every** time they failed...

The TCR cycle

source: https://medium.com/@kentbeck_7670/test-commit-revert-870bbd756864

Setting up the environment for TCR

<https://github.com/nvoulgaris/tcrPlayground>

Why should I try it?

- Baby steps
- Gamification
- Improves refactoring
- A tool for understanding legacy code

Downsides

- Losing stacktraces
- Losing failed test output
- Commit messages
- Frustration

Open questions

- Reverting tests?
- When do we push?

Thank you
